

```

void walk_addr_range(mm, addr, end) {
    alock_t *lock = aspace_lock(mm, addr, end);
    titer_t *iter = tentry_iter_start(addr, end);
    while (tentry_iter_has_next(iter)) {
        size_t size;
        tentry_t *tentry = tentry_iter_next(iter, &size);
        ...
        err = ops->tentry(tentry, addr, addr + size, walk);
        ...
    }
    tentry_iter_end(iter);
    aspace_unlock(lock);
} /* TODO */

```

Lock address range only
once for batched operations

Exploit page table entry adjacency to
reduce page walk overhead.
Can internally implement it as a `pte++`

A custom function uses entry pointers to
perform in-place attribute updates
