

```

void walk_addr_range(pmap, a
...
err = pmap_pte_entry(pmap, addr, end, walk);
...
}

```

No low-level exposure, need to add a new pmap function for the same pattern

Alternative Implementation

```

void walk_addr_range(pmap, addr, end) {
    for (; addr < end; addr += PAGE_SIZE) {
        ...
        pmap_enter(pmap, addr, ...);
        ...
    }
}

```

Use PMAP_LOCK(pmap) to lock the entire pmap internally

Explicitly implement the task, may need repetitive walk in the page table data structure
