

```
void walk_pte_range(mm, addr, end) {
```

```
    spinlock_t *ptl;
```

```
    pte_t *pte = pte_offset_map_lock(mm, pmd, addr, &ptl);
```

```
    for (;;) {
```

```
        ...
```

```
        err = ops->pte_entry(pte, addr, addr + PAGE_SIZE, walk);
```

```
        ...
```

```
        addr += PAGE_SIZE;
```

```
        pte++;
```

```
        ...
```

```
    }
```

```
    pte_unmap_unlock(pte, ptl);
```

```
} /* mm/pagewalk.c */
```

Lock address range only
once for batched operations

A custom function uses entry pointers to
perform in-place attribute updates

Exploit page table entry adjacency to reduce page walk overhead
